Author Audition

Meet Codex: OpenAI’s coding agent

Reads your repo

Writes the change

Runs your tests

You review the diff

Give it a task in plain English. It works in your repo like a teammate.

Codex app · CLI · IDE extension. Today: the Codex app on Windows.

Author Audition

Overview

Codex writes the code in minutes.
Now reviewing is the slow part.

📝 Writing — 5 min

🔎 Reviewing — 30 min

WHAT'S IN IT FOR YOU

Let Codex do the first review, so you only check what matters.

1 Feature Dev → 2 Senior Reviewer → 3 The proof

The PR Looks Green. Would You Approve It?

app/profile.py

```
def upload_avatar(user_id, file):
    destination = AVATAR_DIR /
f"{uuid4().hex}.png"
    with open(destination, "wb") as target:
        copyfileobj(file, target)
    return f"/avatars/{destination.name}"
```

💬 The task

Let users upload a profile photo.

✅ **All tests passed**

✅ **Even handles errors**

🤔 Would you approve this PR?

Hold that thought.

Tests check what we asked for. Not what we forgot to ask.

What Happens If We Ship It?

Friday, 5 pm

✅

Tests are green.
PR approved.

Saturday, 2 am

⚠

A rare failure
hits the uploads.

Monday, 9 am

🔥

Broken profile photos.
Tickets pile up.

Monday, 10 am

🙋

"Who approved
this PR?"

The fix takes minutes. A bug in production costs your users, and your weekend.

Today: catch it before you click Approve.

Author Audition

Every Pull Request Needs a Second Pair of Eyes

vs

Feature Developer

“Did I satisfy the ticket requirements?”

Senior PR Reviewer

“What breaks this in production?”

Codex wears both hats. Never in the same prompt.

Switch hats with /review

1

Type /review
in the composer

2

Add your questions
Fails halfway? Who can call it? Empty or huge?

3

Read the findings
On the lines, most important first

4

You decide
Codex changes nothing

Two ways to ask:

/review → quick general check

/review + your questions → deep check

↑ today

Decide what to fix. Keep it small.

```
def upload_avatar(user_id, file):

    with open(destination, "wb") as target:
        copyfileobj(file, target)
```

💬 Codex's finding

Bound the upload size: huge input can fill the disk.

You send:
"Fix the findings, a test for each. Keep the scope minimal. Authorization: follow-up ticket."

Codex: small fixes + tests.
Nothing else touched.

Build → **Review** → **Commit**

Never jump straight from Build to Commit.

Demo

First the Feature Dev, then the Senior Reviewer.
Same Codex, same app.

1. Ask Codex to add profile photo upload (Feature Dev)
2. /review + the reviewer’s questions (Senior Reviewer)
3. **Decide what to fix now, and what to defer**
4. **Small fix, then review again**

One review. Real risks caught.

Feature Dev only	Feature Dev + Senior Reviewer
✓ Photo upload works	✓ Photo upload works
✓ 3 tests pass	✓ 8 tests pass: new tests for each fix
✗ 3 hidden risks the tests missed	✓ 2 risks fixed, 1 ticketed (authorization)

The tests were green both times. The review made the difference.

Your turn: one habit

`/review`

After every Codex task. Before every commit.

- 📁 **What if it fails halfway?**
- 🔑 **Who is allowed to do this?**
- 💥 **What if the input is empty or huge?**

Questions a senior reviewer asks. Check that the findings cover them.

Summary

Review is the new bottleneck

Switch hats: /review + your questions

Decide what to fix. Keep it small

Codex finds. You decide
